

It is my sincere hope that the commission seriously considers the adverse effects that IBOC will have on analog listening of the AM broadcast band. One of the biggest complaints consumers have about AM is the lack of fidelity. This is an ongoing problem because of the lack of quality receivers, but there are those like myself, who enjoy listening to AM radio with a quality wide band AM stereo radio. The IBOC plan in it's current form will force ALL AM listening to be of poor, low quality bandwidth, and the fact that tests seem to prove that it will not work at night, what is the point ? It is my hope that the commission NOT approve IBOC in it's present form.
